

## **Polynomial degrees for hypersurfaces with non-isolated singularities**

Israel Vainsencher (UFMG)

### **Abstract:**

Formulas for the degrees of loci of hypersurfaces with a few (not many!) isolated singularities have been known from almost the beginning of times. I will concentrate on two main examples:

- the degree of the locus of Whitney's umbrella cubics (old, joint with Daniel Coray) and
- ditto for the Steiner roman quartics, fresh from the oven, joint with Adriana Rodrigues Silva.
