

## The Sarkisov program for Mori fibered lc Calabi-Yau pairs

Anne-Sophie Kaloghiros (Brunel University, UK)

### **Abstract:**

A Mori fibered Calabi-Yau pair  $(X,D)$  is a pair of a normal variety  $X$  and a reduced divisor  $D$  such that  $K+D$  is a Cartier divisor linearly equivalent to 0, and such that  $X$  itself has a structure of Mori fibre space. Such a pair is the end product of two distinct Minimal Model Programs: on the one hand, it is a  $K+D$ -minimal model, and on the other it is the end product of a classical MMP. In this talk, I will present a general Sarkisov-type factorization theorem for birational maps between Mori fibered Calabi-Yau pairs, and I will discuss the singularities of 3-fold Calabi-Yau pairs.
