

From graphs, to polytopes, to Ehrhart polynomials

Cristina G. Fernandes (USP), J.C. de Pina, J.L. Ramírez-Alfonsín,
S. Robins

Resumo/Abstract:

Liu and Osserman associated to each cubic graph a polytope and the corresponding Ehrhart quasi-polynomial. They studied these polytopes and quasi-polynomials, and conjectured that all connected cubic graphs with the same number of nodes and edges have the same Ehrhart quasi-polynomial. We prove this conjecture.
