

## Minkowski content of random sets

**Gregory F. Lawler**<sup>1</sup>,

<sup>1</sup> University of Chicago

Minkowski content is a way to give the fractal measure of sets. Although it is not defined for all subsets of  $\mathbb{R}^d$ , it is often defined and nontrivial for random fractals giving the appropriate fractal parametrization or occupation measure. It also gives the natural scaling limit for the normalized counting measure on discrete objects. I will discuss the basic idea and then discuss particular cases: Schramm-Loewner evolution, loop-erased random walk, cut points for Brownian motion, percolation. This will include work with a number of authors, M. Rezaei, C. Beneš, F. Viklund, N. Holden, X. Li, X. Sun.
