

# Topics in stochastic gradient approximation

**Philip Thompson**<sup>1</sup>

<sup>1</sup> University of Cambridge

In this talk we will consider the use of stochastic approximation of first-order information in stochastic optimization and a class of statistical learning problems, focusing on convex objectives/losses. These are methods which are successful in many situations in practice due to their simplicity and scalability. We discuss aspects of such type of algorithms and, in some specific sense, their approximate "robustness".
