Isoperimetry and volume preserving stability in real projective spaces

Celso Viana[1]

[1] Universidade Federal de Minas Gerais (UFMG)

In this talk I will address the problem of classifying volume preserving stable constant mean curvature hypersurfaces in Riemannian manifolds. These objects are characterized for minimizing area up to second order under volume constraints. I will present recent classification in the real projective space of any dimension and, consequently, the solution of the isoperimetric problem in these spaces.
